Krull¹, Deo Kumar Srivastava⁵, Christopher B. Forrest³, Melissa M. Hudson^{1,2}, Leslie L. Robison¹, I-Chan Huang^{1,*} Departments of ¹Epidemiology & Cancer Control, ²Oncology, ⁴Pediatric Medicine, ⁵Biostatistics, St. Jude Children's Research Hospital, Memphis, TN, and ³Children's Hospital of Philadelphia, Philadelphia, PA.

BACKGROUND

- Childhood cancer survivors often experience treatment-related late effects which impact their health-related quality of life (HRQOL).
 Differences in preferences for content and clinical relevance of
- HRQOL items are understudied among clinicians, parents, and childhood cancer survivors.
- PROMIS Pediatric measures contain cutting-edge item banks. It is useful for clinicians, parents, and cancer survivors to rate the HRQOL items that are important for survivorship care.

OBJECTIVE

• To compare the importance ratings of PROMIS items between clinicians, parents of childhood cancer survivors, and survivors across pain interference, psychological stress, fatigue, and positive affect domains. We hypothesize that there is a larger difference in the importance ratings for items between clinicians and childhood cancer survivors than between survivors' parents and survivors.

METHODS

Participants

- 101 childhood cancer survivors and their parents recruited from the St. Jude Lifetime (SJLIFE) Cohort Study.
- 36 St. Jude's health professionals including clinicians, nurse
- practitioners, psychologists, and social workers.
- Inclusion criteria:
 - Cancer survivors: 1) 8–17.9 years of age; 2) ≥ 2 years off therapy; 3) ≥ 5 years since diagnosis; 4) ≥ a 3rd grade reading level; and 5) able to read English.
 - Parents: 1) parents/legal guardians of eligible survivors; and 2) able to read English.
 - Clinicians: ≥ 2 years of survivorship care expertise.

Data Collection

- Clinicians, parents, and children completed respective HRQOL surveys at St. Jude using an online program (OptimalSort©).
- Participants were asked to identify eight items from each of the PROMIS item banks that are useful for clinical decision making and communication between survivors and their clinicians.

PROMIS Pediatric Item Banks

- Pain Interference: impact of pain on daily activities (20 items).
 Psychological stress: emotional and mental response to internal
- Psychological stress: emotional and mental response to inter and external challenges (19 items).
- Fatigue: subjective feeling of being tired to an overpowering, crippling sense of exhaustion (23 items).
- Positive affect: temporary affirmative experiences (37 items). Statistical Analysis
- For each item, the percentages of clinicians, parents, and children who rated it as important were calculated.
- Odds ratios (ORs) of an item's importance rating among respective clinicians and parents vs. children (the reference) were calculated.

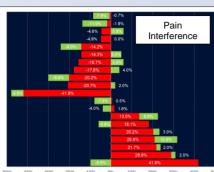

RESULTS

Table 1: Characteristics of Clinicians, Parents, and Survivors

· · · · · · · · · · · · · · · · · · ·		
	Mean (SD)	
Child's Age at Evaluation	13.9 (2.9)	
	N (%)

Feel great	-	0.43*
Feel satisfied	-	0.41*
Feel joyful	-	0.33**
Feel strong	-	0.30***
Feel delighted	-	0.25*
* P-value < 0.05, ** P-value < 0.01, *** P-value < 0.001		

* P-value < 0.05, ** P-value < 0.01, *** P-value < 0.001

CONCLUSIONS

Clinicians, parents, and survivors hold differing views on what
 content of LIPOOL items are important to survivorship care

- content of HRQOL items are important to survivorship care.
- When designing HRQOL measures, methods to synergize heterogeneous preferences across stakeholders should be applied.
