BACKGROUND

- Gastric cancer has a high incidence and mortality rate worldwide, and more than 55.2% of gastric cancer survivors are older adults. These older survivors face increased comorbidities, high societal healthcare costs, and decreased health-related quality of life (QoL).
- Late effects of cancer and its treatment, which are chronic conditions, contribute to the low QoL reported by survivors even after treatment ends. Identifying symptom clusters, where two or more symptoms co-occur, is important for effective interventions.
- Previous studies have focused on adult cancer survivors or single late effects, limiting our understanding of comprehensive late effects in older gastric cancer survivors.
- To explore late effects, symptom clusters, symptom burden, and their impact on QoL in older gastric cancer survivors using a mixed methods approach based on theory of unpleasant symptom.

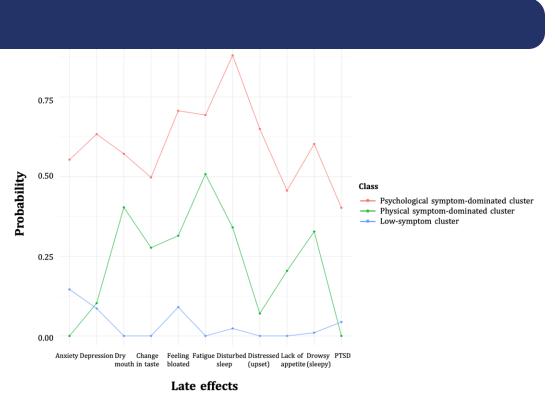

METHODS

• Research design: Explanatory sequential design of mixed methods research

	Quantitative study	Qualitative study
	Quantitative study	
Aim	• To identify late effects and symptom clusters	• To explore the experience of symptom burden
Design	 Cross-sectional descriptive study 	Qualitative descriptive study
Participants	• Gastrectomy, aged 65 years or older at diagnosis	• Participants in the quantitative study: 12 in total (Response rate: 35.3%)
Data collection	 Constructed questionnaire (89questions) May 15-December 21, 2023 (response rate: 39.4%) Total 139 participants 	 Individual in-depth interviews (average 61 minutes): February 27- March 11, 2024 Hospital conference room or preferred "What symptoms do you experience after your cancer treatment is over?"
Data analysis	 Descriptive statistics, Independent t- test, one-way ANOVA Latent class analysis Multiple linear regression 	 Inductive content analysis Trustworthiness: credibility, fittingness, auditability, confirmability
		RESULTS

1. Quantitative study

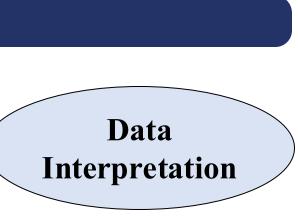

- The mean age was 73.3 years. mean postoperative survival was 60.7 months. 81% were diagnosed with cancer stage Ia.
- The emotional/informational support was the lowest. 38.3% reported clinically significant fear of cancer recurrence.
- Physical QoL was lower at 28.1% and psychological QoL at 15.7% compared to the general population. The most common moderate to severe late effects were fatigue, feeling bloated, disturbed sleep, dry mouth, and drowsy.
- Symptom clusters were categorized into "low-symptom cluster," "physical symptom-dominated cluster," and "psychological symptom-dominated cluster."

<Latent classification of older gastric cancer survivors>

RESULTS(cont'd)

To provide a comprehensive understanding of QoL

Connecting, **Building**, Merging

Triangulation protocol: Convergence, Complementarity, Discrepancy

1. Quantitative study (cont'd)

• Factors that negatively impacted QoL included daily performance of functions, fear of cancer recurrence, and both physical and psychological symptom clusters, while positive factors included a longer postoperative period and higher social support.

2. Qualitative study

• Participants: 65–81 years. a mean postoperative duration of 29.4 months. 8 in the physical symptom-dominated cluster, 4 in the psychological symptom-dominated cluster.

<Experience of late effects in older gastric cancer survivors > Categories **Subcategories** Not the same as before surgery with mixed discomfort • Uncomfortable with symptoms related to eating • Living with a variety of symptoms • Withdrawn after surgery Actively managing symptoms after surgery • Being supported by others

- 3. Integrate quantitative and qualitative data
- Integration identified 5 themes and 13 subthemes, including
- \checkmark maturation effects over time after surgery
- ✓ fear of cancer recurrence has different affects individually
- ✓ influence of social and family support
- ✓ experiencing the combined late effects associated with older age, cancer, and gastrectomy
- ✓ **QoL** with endeavor and endurance

CONCLUSIONS

Comment in the transitional survivorship Dominant in the extended survivorship

Impact across survivor time Compact across survivor time

- The findings highlighted the distinct characteristics of symptom clusters according to survival stage and the need for psychological symptom management.
- The study supports the potential effectiveness of self-management interventions for late effects and holds promise for improving the QoL of older gastric cancer survivors and reducing societal healthcare costs.

- Waiting for time to pass without problems
- Psychological symptom-dominated clusters are more of a struggle
- Initiating efforts to live a healthy life after surgery
- Managing health on my own without guidance
